

The Challenge

Tackling the Health Impacts of Social Isolation and Loneliness on Older Adults

- An Angus Reid survey found that 48% of Canadians reported themselves as being socially isolated, lonely, or both. (Reid, 2019)¹
- Loneliness and social isolation are associated with an increased risk of death. (26% and 29%, respectively) (CDC, 2021)²
- Social isolation among older adults is associated with increased chance of premature death; depression; dementia; disability from chronic diseases; poor mental health; increased use of health and support services; reduced quality of life; poor general health; and an increased number of falls. (National Academies of Sciences, Engineering, and Medicine. 2020)³
- The CCSMH has undertaken developing the first clinical guidelines addressing social isolation & loneliness.

Defining Social Isolation & Loneliness: It's Complex.

Loneliness

An internal subjective experience; it is an unpleasant sensation felt when a person's social relationships are lacking in quality and/or quantity compared to what they desire. A "subjective" assessment that social relationships are lacking.

The Opportunity

Strengthening the Relationship Between Older Adults and Health Care Providers

"Family physicians and other primary care providers might be the only point of social contact for many older patients ... [J]ust as physicians screen for other risk factors, there might be a role for primary care physicians to identify patients who are isolated, lonely, or socially vulnerable and to recommend evidence-based interventions that could strengthen social connection" (Freedman and Nicolle, 2020)⁴

"Although the health sector cannot solve this problem alone, the medical community does need to respond. Clinicians will require adequate training, resources, and support to integrate screening, interventions, and referrals for SIL into their existing responsibilities. Patients' lives may hang in **the balance**" (Holt–Lunstad, 2022)⁵

Social Isolation & Loneliness in Older Adults Guidelines Project

Executive Director, CCSMH

Bette Watson-Borg, Project Manager, CCSMH

<u>Lisa Tinley,</u> Outreach Coordinator, CCSMH

Summary of Draft Recommendations

Prevention:

- Clinicians should know and be able to identify major risk factors associated with social isolation & loneliness, and to anticipate with their patients possible changes in their life circumstances that could put them at risk of social isolation and loneliness.
- Education on SI&L should be part of the curriculum for health and social service students as well as practicing clinicians.

Screening and Assessment:

- Clinicians should screen patients who show risk factors for social isolation and loneliness (using appropriate tools).
- A thorough clinical assessment should aim to explore possible causes and identify any underlying health conditions that may be contributing.

Summary of Draft Recommendations

Management and Intervention:

- isolation.

Possible Interventions May Include: Social activity

Social Isolation⁶

A measurable deficiency in the number of social relationships that a person has. An objective deficit in connection to family, friends or the community.

For more information, contact:

Bette Watson-Borg, Project Manager socialconnections@ccsmh.ca

John Saunders, Communications and Knowledge Translation Coordinator, CCSMH

• Clinicians should apply principles of shared decision making and an individualized approach to manage loneliness and social

 Interventions should take into account the individual's culture and recognize the diversity of older adult populations.

Physical activity

Social prescribing

Psychological therapies
